

$$f(x) = \frac{x^5 - 2x^2 + 3}{x^3 + 1}$$

$$y = x^2$$

A graph showing two functions on a Cartesian coordinate system. The x-axis and y-axis are represented by thin gray lines. A solid black curve, representing $f(x) = \frac{x^5 - 2x^2 + 3}{x^3 + 1}$, is plotted. It starts in the upper left, dips to a local minimum, rises to a local maximum at the y-axis, dips to another local minimum, and then rises steeply. A dashed red parabola, representing $y = x^2$, is also plotted, opening upwards with its vertex at the origin. The two curves intersect at two points: one in the second quadrant and one in the first quadrant.
